Category:PianoA polydimethylsiloxane (PDMS) microchannel was fabricated using soft lithography technique. In this microchannel, a U-shaped constriction was generated at the center of the microchannel by nanosphere lithography technique.

In the constriction, a droplet could be trapped. The trapped droplet can be released by applying a controllable pressure. The release process was captured by using an inverted fluorescence microscope. The polydimethylsiloxane (PDMS) microchannel was fabricated using soft lithography technique. Q: Programming language for embedded systems I want to program an embedded system. Initially, I only need to do low level stuff like write to variables, read/write files, handle interrupts, etc. I would like to program this system in C, although my friend suggested me to use Python instead. I am really a newbie in the embedded programming world. Besides, I never think to test the embedded system by using an IDE. Usually, I write all the code manually in the GCC. I just want to know if there is any best programming language for embedded systems? I am particularly interested in C, C++, Python, or any embedded programming languages. A: If your requirements are limited, C is a good choice. If you need Python or some other scripting language, you might find the learning curve steep. It's a mistake to assume that you can pick the best language just because you are a newbie. Every language comes with huge libraries, and every library comes with huge amounts of potential pitfalls. If you want to get the best results, you need to learn, and you need to learn as much as you can about your target platform. The best way to find out what you need to know is to go and look into it in more detail - try to understand how the target operates, and write a small application. Even if your application isn't very big (e.g. a couple of bytes of main code and a few tens of K), you will learn a lot by doing this. Q: Index into
