What if you lost your app's serial number (ISOs and signed apps)? Do you have a backup? How do you manage to create a password and remember it? Where do you store the master key for your private networks? Is it secure enough to play your favourite game? So many questions... so many answers. Enter Serial KeyGen. Software developers know how much hard work goes into creating a functional application. So when it comes to protecting it with a serial key, you'd better make sure it is a strong one

that cannot be broken. Serial KeyGen aims to help you do that. Distraction-free GUI The utility packs a straightforward interface that makes it easy for you to focus on generating your serial keys. You can also use it to create passwords, yet, since the app is designed to create mainly serial keys, it does not support inserting special characters. This means that your passwords are not as bulletproof as they might be, so it is best if you stick to generating only serial keys. Generate many serial keys at once Before taking advantage of the feature-set of Serial KeyGen, you need to specify the types

of characters you want to include. You can choose between numbers, uppercase or lowercase letters. You can also define how many blocks you need, along with the number of characters and the delimiter type. The final step is to enter how many serial keys you want to obtain, then press the Generate button. Export the list of keys Regardless of how many serial keys you need, Serial KeyGen allows you to save the list for later use or analysis. You can export it to TXT, CSV or SQL. For the last format, you can define some additional parameters (DB type, table and field names, ID string).

Alternatively, you can copy the list to the clipboard and paste it in a document of your choosing. To summarize In a nutshell, Serial KeyGen can become the go-to solution for all those who need to quickly create many serial keys at the same time. Then, they can export the list and move on with their work. Description: What if you lost your app's serial number (ISOs and signed apps)? Do you have a backup? "Serial KeyGen" Review 2016-09-19 William Ackard "Serial KeyGen" 5 Saved Rating: 12345 User: William Ackard Review: The purpose of this software review is to point out certain issues with the software that its developer was aware of, and that users

of the software probably were not. That being said, I decided to write this review. I have no particular intent other than to share a common issue with other people. My hope is that it will lead to further questions on the part of the software developers or in their support forums, and that it will encourage others to review other software they've purchased. (I'm sure there are lots of good programs out there. Please let me know in the comments if I have missed any, and I'll update the list.) The review is organized into a few parts. The first will describe what the developer was

aware of about the product, and the second will describe the issues that users were likely not aware of, but which may have been the source of problems. I will not say much about the software itself. The main reason is that the software developer has been very supportive of my research and findings and has already made significant modifications to the program, which I am very grateful for. What was known? The software developer, a Russian named Veselin Ivanov, wrote the following: "Hi! Thank you for your reviews! I can confirm that it does not make sense to remove serial keys. It's

simple fact that new serial keys are generated always (even if you change some system properties or other stuff). I'm looking into this. There's a logical explanation. I have fixed this." This is good news. I asked about this problem because I have seen it happen to many users. But let's assume that there are a lot of cases where users do not notice that they have mistakenly removed serial keys from the list, because they've removed too many of them. So Veselin's information here is important to users. Users also noticed that, when they accidentally delete some serial keys, they do not re-generate them and

that the serial keys were not removed from the list, so they could try to re-generate them. This leads to some key confusion, because for example, the first serial key they generate is in fact a re-generated one. The second part of
