Seagull is based on a simple and powerful mechanism to generate protocol traffic in network or router environments. Seagull generates a lot of network traffic in order to simulate scenarios involving a given number of sessions, clients or users. It comes with a powerful syntax and an easy interface. With just a few parameters, one can specify:

- The number of sessions to be generated
- The type of session to be generated (call, SMS, web browsing, game)
- The application (e.g. voice, video)
- The used protocol family (e.g. Diameter, GSM, SMS, H225, TCP, TCP/IP)
- The protocol version (IPv4 or IPv6)

The generated traffic can be sent to a file or to any network interface. In addition, Seagull can generate by source (Diameter, Radius, etc.) or by destination (IPv4, IPv6, etc.) and can be logged to a file as well. Here is a full list of the parameters:

1. Int (integer) The number of sessions to be generated.
2. Bool (boolean) By default, Seagull generates traffic by source. Set this parameter to False (0) to generate traffic by destination.
3. Ipv4 Generate IPv4 traffic (default).
4. Ipv6 Generate IPv6 traffic.
5. UDP Generate UDP traffic.
6. SCTP Generate SCTP traffic.
7. TCP Generate TCP traffic.
8. TCPv6 Generate TCPv6 traffic.
9. TCPv6-Small (Diameter, Radius) Generate TCPv6-small traffic.
10. TCPv6-Large (Diameter, Radius) Generate TCPv6-large traffic.
11. TCPv6-Unlimited (Diameter, Radius) Generate TCPv6-unlimited traffic.
12. TCPv6-Fallback (Diameter, Radius) Generate TCPv6-fallback traffic.
13. Text (H248/HTTP/XCAP/ASCII) Generate text traffic.
14. Application (Voice, Video) Generate application traffic.
15. Param (string) Parameter name.
16. L {min,max} (integer) Set the session

This is a universal framework for producing valid (for their respective underlying protocol) RTP streams with a desired/fixed bitrate. It was designed for debugging, testing, system testing, benchmarking, and other tests for Media RTP. The intention was to make the generation of such streams a matter of few lines of code. It also allows to perform a stream resizing/reduction. The current implementation allows up to 8 simultaneous UDP/RTP connections, and up to 64 input and output channels. The first implementation supports the following protocol families:

- RTP (UDP)
- RTSP (TCP)
- H.323 (TCP)
- SIP (UDP/TCP)
- H.323 (TCP)
- H.245 (TCP)
- SCCP (UDP/TCP)
- RTP/SCTP
- RTP/SCTP and TCP/UDP
- RADIUS (HTTP, TLV)
- Diameter (HTTP) (required)

Configuration:

- Configuration is available via two distinct methods:
- Command-line options:
- Include the filename of the configuration file:
- By using the existing configuration file:

Seagull is very easy to setup and use, just few steps are needed to generate the traffic and start the test. The traffic are generated from a built-in FIFO server which is designed for running tests in a simulator. The traffic can be sent in parallel on more than one physical interface of the device. You can choose among different application states (e.g. idle, connected, BDPG, LBT, sending, receiving). You can monitor the traffic generation with the built-in statistics system or directly on the console. You can set different types of traffic flows: · Standard UDP/TCP traffic - up to 32 concurrent connections · Random Unstructured Traffic (UDP/TCP/ICMP) · Random TCP/ICMP · Periodic TCP/ICMP traffic · Active TCP/ICMP traffic · Connection count · Session count · Packet sizes · Sequence numbers · Byte sequence numbers · Checksum · TCP/IP header fields You can set the variable traffic parameters in one of three ways: · Values in the embedded text file · Via a variable at the console · Via a variables file (external or internal) Apache Shiro is a Java and Servlet web application security framework. It includes an access control mechanism based on a declarative Java security model. The framework supports role-based access control as well as the specification of access control for classes, methods, fields, and parameters. The ability of Maven to do the job for me. It will let me create an aggregated "release" artifact that pulls in all the binaries for all the different platforms we support and convert them to a single file. I'll have to use it and figure out how to do this on some other build system. Traefik is a modern reverse proxy that routes your traffic based on your domain name. It uses a modern, clean, and intuitive configuration language (YAML). It has a powerful plugin system that can be used to implement all kinds of applications. Alpine 3D is a command line tool for generating simple ASCII 3D models and viewing them in various ways, primarily as interactive 3D PDFs. You can use it to create simple 3D models with various features. If you want to create more complex models, look at the example models in the examples directory. Music is a tool for managing music libraries. It is designed

What's New in the?

Seagull is a handy multi-protocol traffic generator. Primarily aimed at IMS (3GPP, TISpan, CableLabs) protocols (and thus being the perfect complement to SIPp for IMS testing), Seagull is a powerful traffic generator for functional, load, endurance, stress and performance/benchmark tests for almost any kind of protocol. In addition, its openness allows to add the support of a brand new protocol in less than 2 hours - with no programming knowledge. For that, Seagull comes with several protocol families embedded in the source code: · Binary/TLV (Diameter, Radius and many 3GPP and IETF protocols) · External library (TCAP, SCTP) · Text (XCAP, HTTP, H248 ASCII) Seagull Description: Seagull is a handy multi-protocol traffic generator. System Requirements:

* Note: The.exe version of the program can be run from any standard Windows user account. * Note: The.exe file has been digitally signed by EA. * Note: The C++, Python, Lua and Flash versions require Python and Lua to be installed. Gameplay: * Note: All versions have unique gameplay features. The.exe is playable in single-player mode. • Changes to Soldiers, Artillery and vehicles • Changes to weather • Changes to maps and modes • Changes to gameplay elements
