TCP-File

TCP File is a simple to use tool that can log data from any TCP/IP device that sends data to your PC's TCP/IP port. The program can be run as a server that logs data received via one or more client

connections, or as a client that logs data sent by a server. TCP File can be used to log data received from various TCP/IP devices (server) or devices connected to your computer (client). For example, if your computer is connected to a network through a modem/router/switch and you want to log data received from a remote telephone number, email address, web site or any other TCP/IP device, you can run TCP File as a server. If you are running as a TCP File client then the application will be connected to TCP/IP device(s) as shown in the network diagram. Also, TCP File provides features that are not available in the stand-alone version:

- ☐ TCP File can log data received via a network connection of any protocol;
- ☐ TCP File can log data received via a serial port;
- ☐ TCP File can also be used as a simple TCP/IP server;
- ☐ TCP File can log data to a local disk file;
- ☐ TCP File can log data to a disk file on a remote computer;
- ☐ TCP File can be installed on a UNIX or Windows based PC;
- ☐ TCP File can be installed in multi-user mode;
- ☐ TCP File can be installed in client mode;
- ☐ TCP File can be installed in server mode;
- ☐ TCP File can be installed in a stand-alone mode;
- ☐ TCP File can be used with Terminal Servers.

TCP-File

TCP-File (Transfer Control Protocol File) is the successor of Serial-File. It is a multi-tasking application that provides robust, high-performance file logging and transferring. It supports both client and server TCP/IP connections. TCP-File allows users to create multiple client connections to the same server. For each client connection there is one log-file. Depending on your Terminal Server or RS232 or RS485 serial device setup you might need to change some parameters. Here is the list of different types of setup you might need to change depending on the Terminal Server or RS232 or RS485 serial device that you use: 1. TCP/IP Address (e.g. IP Address, Port Number) 2. CWD (Command Work Directory) 3. ExtClash (Programmer need to change this) 4. TCP/IP buffer size 5. If you have multiple Terminal Server you might need to change the number of Terminal Servers Logging... Compares the Numeric Properties of the first of two objects. Compares the Numeric Properties of the second of two objects. Compares the Numeric Properties of the Nth of two objects. Compare Numbers Compare Numbers permits you to compare the Numeric Properties of two objects (for example, two text files) and return a Boolean value based on the comparison. The comparison is done according to the source order. That is, if you compare the first number of one object to the first number of the second object, and the second number of the first object to the second number of the second object, the result is true if and only if the first number of the first object is greater than the first number of the second object, and the second number of the first object is equal to the second number of the second object, or if

the first number of the first object is equal to the second number of the second object and the second number of the first object is less than the second number of the second object. This function is useful for comparing numeric properties of objects to determine if they are equal. Comparing Numbers Source Order Object Number Object Number Compare procedure Source Description Object Number Compares two or more objects and returns the correct numeric properties of the first object. Usage Compares Numbers procedure Source. Example Compare Numbers procedure Source 10 20 30 Less than or equal to: Example Print Number 1.0 10.0
