Once you've selected a drawing style that best suits you, you can set a look and feel for your drawing to give it a professional touch. Using AutoCAD, you can document your ideas quickly and accurately. Create professional-quality drawings, either in one continuous drawing or by breaking your drawing into separate files. Others A prominent client-server protocol for Autodesk products is over the Internet, Autodesk Communication Protocol (ACP). ACP allows a CAD system to be distributed in a client/server configuration where the client portion of the software resides on a user's desktop, and the server portion resides on a centralized server machine. The software on the client side provides a user interface for the user to interact with, receives and stores data from the CAD system, and provides a service for transmitting the information over the network back to the server. The software on the server side manages the database, facilitates interoperability with other Autodesk software, and provides a variety of other services. ACP is a proprietary protocol not directly compatible with any other software besides Autodesk software. ACP is not to be confused with Autodesk Communication Server (ACS), which was also part of the older product suite, Autodesk Communication Server (ACS) 1.0. This component only serves to provide a bridge to communicate with Autodesk products. Q: Dynamically adding a RadioButton to a DataGridView I'm trying to add a RadioButton to a DataGridView so that I can give the user the option to 'Do Not Display'. I have this as my test class: Public Class GridTest Private _R1 As RadioButton Public Sub New() InitializeComponent() _R1 = New RadioButton() _R1.Location = New Point(30, 30) _R1.Size = New Size(20, 20) _R1.Text = "RadioButton1" _R1.Checked = False dataGridView1.Controls.Add(_R1) End Sub Private Sub test() Me.Controls.Add(_R1) End Sub End Class If I run the code it will add the first RadioButton but if I run it again it will just add another blank RadioButton. A: you're adding the RadioButton in the constructor of the Form you should add it when the User wants to add it or remove it when the User wants to remove it Add it to the Controls collection of the Form You might have to move this method outside of the form and call it when you want to add the button Public Class Form1 Private _R1 As RadioButton Private Sub Form1_Load(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles MyBase.Load InitializeComponent() End Sub Private Sub Button1_Click(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles Button1.
