A: As linux-daemon suggests in the comments, you should download the file you want and extract it using un^op e.g.

```
$ sudo unzip filename.zip
```

Using unzip should allow you to decrypt the zipped file and extract the contents. The directory should now contain the file you want to get access to. If that does not work for you, you could always try to extract the file using 7-zip which is a free, open source zip-file-compressor used under Microsoft Windows and Linux.

```
$ sudo unzip filename.zip
```

If that does not

work, you could always try using the free and open source alternative to 7-zip, 7z. You can install it via: `$ sudo apt-get install p7zip` A: Right click on your zip, choose "extract here", or use UNPACKER It is free and open-source software. The perfect solution

Characterization of neuropeptides and their receptors in early development of the brain of *Clupisoma platyra*: Immunocytochemical findings. Brain development during embryonic stages of *Clupisoma platyra* is poorly understood. Neuropeptides and receptors are important

components of the central nervous system and are involved in the regulation of a number of physiological processes during development of the brain.

Here, we aimed to characterize the development of the neuropeptides and their receptors in this early fish. For the first time, we used anti-neuropeptide antisera to investigate the distribution pattern of neuropeptide-containing neurons in pre- and post-hatching *C. platyura* embryos. In the prehatchling brains, immunolabelling was observed for all four well-established neuropeptides

(PACAP, secretoneurin, somatostatin, and galanin).

Our findings indicate that some of the neuropeptides were already present in CNS of early embryos, and there is no evidence that some of the neuropeptides involved in the regulation of the maturation process of the brain (e.g. PACAP, galanin, somatostatin). The somatostatin-like immunoreactivity in the prehatchling brains was confined to the periventricular zone of the diencephalon and rhombencephalon with no evidence of rostral/caudal, left/right lateral

@KleineskamMolecular
dynamics of cationic and
anionic dyes in aqueous
solution: analysis of
transport parameters. The
transport of various organic
cation and anion molecules
in aqueous solution is
investigated using Molecular
Dynamics. A range of
parameters is used, including
mass, charge, orientation in
the solvent, and preferred
orientation within the cavity.
It is found that cations prefer
to enter the cavities of the
anion systems in orientations
where at least one anion is
closest to them. The cation
movements are much more

restricted than those of the anions, which is consistent with the accepted model. The efficiencies of transport were found to be related to the polarizabilities of the molecules. The electrostatic interactions between cations and anions were found to play a minor role in the transport of these molecules. The internet is already changing the way we communicate – but soon it could get personal.
