DHCP services allow assigning a list of IP addresses to devices on a network by assigning a specific name to each IP address. This may be necessary when assigning IP addresses is either cost-prohibitive, or if you cannot guarantee that there is enough IP addresses available to be shared. DHCP allows you to more easily control and share IP addresses when adding or removing devices from your network. DHCP can be enabled, disabled or altered via Remote Desktop Connection or the IPConfig command. DHCP agents monitor devices on a network and automatically assign IP addresses when possible. If a device fails or will not assign an IP address, DHCP agent automatically generate a new IP address. There are two modes of DHCP operation: automatic and manual. In the automatic mode, the DHCP server assigns a list of IP addresses to a device, and the device does not need to request an address from the DHCP server. In the manual mode, the DHCP server assigns an IP address directly to a device. DHCP is also capable of requesting the IP address from another DHCP server. DHCP can be used to assign a list of IP addresses to your devices, as a router or modem will often assign several IP addresses to itself and each device attached to it. This is often referred to as automatic IP address allocation. Devices can have a fixed IP address or DHCP can be
