Dolcemodz Star Set 012 Download 136A solenoid valve is a type of electromechanical valve that uses a coil of wire to create a magnetic field around a portion of the valve. The movement of the magnetic field around the coil of wire creates a force that moves a plunger inside the valve to move an inlet valve assembly from a closed position to an open position or to move an outlet valve assembly from an open position to a closed position. However, this type of electromechanical valve does not provide a reliable seal. To be reliable, a seal needs to be created in all positions of the electromagnetic valve (e.g., the open and closed positions). Consequently, there is a need for a solenoid valve that creates a reliable seal, even when the valve is in a completely open position (e.g., an inlet valve assembly that is open to full flow). The present invention relates to a storage system including a cache memory and a hard disk drive, more particularly, to the cache memory and the hard disk drive. JP-A-2005-257368 (U.S. Pat. No. 7,543,057B) discloses a storage system including a plurality of memory modules of a cache memory, a hard disk drive (hereinafter, referred to as HDD), and a cache memory control device and an HDD control device. The HDD includes a magnetic disk, an actuator to drive the magnetic disk, and a read/write head. The HDD control device includes a recording control portion to record data to the magnetic disk, a sector management control portion to manage the management data of the sector on the magnetic disk and the control data of the actuator, and an input/output control portion to input/output data to/from the cache memory. The cache memory control device includes a cache memory control portion to control the cache memory, and a controller to control the cache memory control portion. In this storage system, the cache memory control device and the HDD control device exchange data with each other. When the HDD control device finds that a recording operation of the sector management control portion is not completed (namely, the sector management control portion is busy), the cache memory control device, which controls the cache memory, sends control data for suspension of the recording operation of the sector management control portion to the HDD control device. The controller includes an input portion that is connected with the cache memory control device, receives the control data from the cache memory control
