Randomized clinical trials (RCTs) and observational studies are the two main methods to generate evidence about the efficacy and

effectiveness of treatment. The purpose of this paper is to assess the quality of the information available to inform policy and clinical practice recommendations about the use of isoflurane as an inhalational anesthetic agent. We performed a systematic review of the literature with a random sample of 20% of the references in three core medical databases and in the Cochrane Controlled Trials Register. To assess the quality of the evidence we used the GRADE methodology. RCTs and observational studies examining the efficacy and safety of isoflurane in pediatric and neonatal patients were identified. The most important recommendation that would be modified by the information available is "use of an inhalational agent, not including neuromuscular blockade agents and sevoflurane, for inhalational induction/maintenance of anesthesia in neonates and children aged Enantioselective total synthesis of (-)-trichogin A via a D3-synthetic route. This is the first enantioselective total synthesis of (-)-trichogin A. The asymmetric Buchwald-Hartwig reaction was successfully applied for the first time to the asymmetric synthesis of the meroterpenoid natural product (-)-trichogin A. Key steps include a highly enantioselective cross-metathesis catalyzed by a chiral Grub b7e8fdf5c8
