[3] Even if the Court were to treat each page of the book as if it were one separate webpage, it would still be a profitless exercise. Permutation and combination are identical. During the "grab period," the user must have used four pages. Only four pages would be on the user's machine during the "interpret period." With the result that the total number of pages used would be twenty-four. [4] Shelf-life, unlike shelf-life, is not a fixed value. [5] The time period during which the data for that paper is actually being transferred to the user's machine, the "interpret period," is the period immediately following that during which the user is exercising her "download" right. After the "interpret period" has expired, the "grab period" begins. [6] Columbia University AMS . For downloading solution manual [Electrical Circuits] from e-books-service.net, you need to have purchased the book on e-books-service.net first. For more details - please, refer to FAQ section. a reduction in the stress concentration at the interface of the substrate and the superconducting layer. That is, the critical current density is increased. In the above circumstances, it had been required to develop a novel superconducting thin film material having a high critical temperature, a high critical current density and excellent magnetic and electric properties. It is therefore an object of the present invention to provide a novel superconducting thin film material which has a high critical temperature, a high critical current density and excellent magnetic and electric properties. It is another object of the present invention to provide a superconducting thin film material which can be applied to electronic and communication equipment, such as a magnetic tape or an electronic component. It is a further object of the present invention to provide a superconducting thin film material which is used as a superconductor material of a wire for a superconductor, and in a superconducting magnet, a quench shield material or a microwave shield material. It is still another object of the present invention to provide a superconducting thin film material which is applicable to a biotechnological instrument, an MRI instrument or a nuclear fusion reactor. It is a still further object of the present invention to provide a method for preparing a superconducting thin film material. It is yet another object of the present invention to provide a superconducting thin film material which has a large size and/or a complicated shape, or a thin layer, and which can be easily deposited on a substrate. It is another object of the present invention to provide a superconducting thin film material which has a high critical temperature, a high critical current density and excellent magnetic and electric properties, and in which the desired properties are realized at a practical deposition rate. It is a
