We report a solvent-free, one-pot synthesis of self-assembled, functionalized Au nanoparticles based on the nucleophilic reactions of a protected Au precursor with a carboxylic acid and an amino acid, using t-BuONa as the

---

reductant and hydrazine hydrate as a reducing agent. The resulting Au nanoparticles are characterized using UV-vis spectrophotometry, transmission electron microscopy (TEM), and X-ray photoelectron spectroscopy (XPS). The formation of the first coordinate Au bond in aqueous solution is confirmed by in situ Fourier transform infrared spectroscopy (FTIR). In addition, the as-prepared Au nanoparticles show distinct variations in their chemical composition and surface structures depending on the choice of functional group, which are related to the reduction potential of the carboxylic acid or amino acid. All the Au nanoparticles are well-dispersed in aqueous solution and electrostatically stabilized by the carboxylic acid, and the one synthesized using the amino acid is stable even in the presence of high salt. Their catalytic activities towards the reduction of methylene blue (MB) are enhanced by the introduction of functional groups on the surface, which are a result of their structures and functions. The results indicate that the carboxylic acid and amino acid functional groups introduced on the surface of Au nanoparticles could provide specific structure information and functional properties by controlling their dissociation reactions and consequently enriching their chemical and physical properties.

I was unable to find an official way to do this on the forums and, as far as I can tell, it's not in the current JavaFX 3D

---

Docs. A: The official answer is: No. The reason is because this isn't really realistic from a physics point of view. If you look at the physics of 3D movement, there are two main forces that you need to think about: Gravitational Force Drag While gravity is constant in all 3D space, we have a mass which is affected by drag. The drag is inversely proportional to the surface area of the object, and the surfaces in 3D space are nowhere near simple 2D-planes. Furthermore, the gravity is constant in the 'up' direction. If we look at the gravity equation, we can see that it is:  $g = 9.8 \text{ (N/kg)}$  So in order to have gravity affect something we need to make it change over the course of time. For example, a simple pendulum works because gravity is directly proportional to the length of the pendulum, and this means gravity is effectively constant over time. 3D movement, however, uses a very different model which is based on the concept of a 'vector force'. In this world, gravity affects every vector in space as a simple a vector, while drag and forces from
