What's New in the Install Creator?

===== Install Creator is a program for creating and managing installers and deployment packages. - Create and manage projects in a file, which can be used to configure the software products (installation media, licenses, product keys, installation path, run time library, etc) or to deploy some products. The structure of the project is very simple, there are only three elements: a .iss file, the description of the product and a graphic which serves as a background for the wizard. - Select a template for the installer to quickly create a project. There are three templates (each with their own appearance): Default, Classic with a Bitmap picture, Classic without a Bitmap picture. The Classic with Bitmap Picture installer is a compilation of both. The idea behind the templates is to provide a possibility to change the appearance of the installer. For example, it is easy to replace an installation dialog with another one or change the background color (only works when Classic template was used, Classic with Bitmap picture is always Classic). - Enter the name of the project in the .iss file and the description of the product. - The .iss project file can contain several items of information including installation media, product description, product description (which is the description of the installation path), license text, product path, version number, run time directory and the project authors. - Select a language for the installer. In addition, when a project is finished, an English (U.S.A) or a German version of the license agreement can be added. - Test the project for errors and save it in the file with a .scr extension. - A project can be split into several parts (or sections): installation media, description, license, product, run time. Before building the installer, you can edit each section in the project. A section can have optional items: installation directory (using default values), application directory (using default values), all description, all license, all product, all license and all product. Items can be left empty, and the default values can be used to fill them. The project can have several editions (excluding runtime): trial (excludes the run time directory), unencrypted, encrypted, complete. - Tools for changing the appearance of the project: graphics and dialogs. - By default, a modal installation wizard can be used to present the user a dialog with information. You can also use it to create
