**Malwarebytes Anti-Malware Premium 4.9.2.2054 + License Key torrent or any other torrent from the Applications Windows..This invention relates to a continuous strand material feed apparatus and, more particularly, to a fast feed apparatus for a mandrel of a warp knitting machine. In the fabrication of textile goods in high-speed, continuous operations, it is frequently essential that products or**

---

workpieces, such as fabrics or the like, be fed continuously from a stock supply to a knitting machine on a continuous basis so as to minimize downtime and increase product output. Many textile fabric feeding techniques in continuous fashion knitting machines are in use and known. Two of these techniques are referred to as "pull-feed" and "clutch-feed." In the pull-feed technique, the stock supply or reel is rotated, and the yarn is drawn from the supply and provided to the machine through a feeding mechanism. A yarn brake may be employed to prevent yarn unraveling or undesired slippage during the continuous knitting operation. One disadvantage of the pull-feed technique is that it is difficult to locate the supply next to the fabric, due to the large amount of yarn necessary to permit the pull-feed to take place. In the clutch-feed technique, the yarn supply is not rotated but instead a length of yarn is advanced by a yarn feed

---

mechanism. A first drive mechanism rotates a drive shaft of the feed mechanism, and a second drive mechanism is operatively associated with the rotatable yarn supply. The second drive mechanism rotates the yarn supply in a sequential and predetermined manner to feed yarn from the supply to the fabric being produced. A further disadvantage of the clutch-feed technique is that it is difficult to control the speed of the yarn advance over a long period of time. In particular, the speed is dependent upon the speed of rotation of the supply. A yarn feed apparatus operable in a smooth continuous fashion and which is suitable for providing a fast feed is disclosed in U.S. Pat. No. 4,666,623 to Caliste et al., the disclosure of which is hereby incorporated by reference. The apparatus includes a needle bed assembly for carrying and rotating a supply of continuous strand material. One or more belt or strip feed

---

mechanisms engage the continuous strand material to provide a fast feed of the material to the needle bed. The apparatus may be used in conjunction with a vertical knitting machine having a stationary needle bed and a knitting carriage which reciprocates back and forth along the needle bed
