Perhaps the most egregious example of waste caused by the energy industry is the ever-rising cost of oil. Since its inception, fossil fuel production has been a source of significant energy-related waste, as has been the case with nuclear production, coal mining, and natural gas exploration and production. This Article explores whether wind turbines have less waste, both literally and figuratively. The main drivers of waste in fossil fuels are the materials inputs, operators, development and operating costs. These costs are set in a market that increases in efficiency and bakes in more productive designs so that the amount of waste created continues to decline. With this in mind, the "solid waste" produced by wind turbines is likely to become less of an issue in the future. Instead, the issue is waste generated by fossil fuel plants, which we will refer to as "liquid waste" in this article. Waste in fossil fuels has two main drivers: energy consumption and the cost of producing it. The amount of energy required to produce any crude oil or natural gas is very high - and it continues to rise as producers develop more efficient methods of production. In some cases the cost is considerable. The cost of producing a kilowatt hour (kWh) of energy with a natural gas-fired plant is approximately six cents; on the same scale, it is two cents with a solar photovoltaic (PV) plant. Nevertheless, production of energy through crude oil or natural gas is significantly less expensive than the cost of producing energy with wind or nuclear power. Not all of the energy produced by fossil fuel plants is waste - at least a portion is used to produce electricity, and some amount of energy is needed to operate the plant. But the cost of producing energy through fossil fuels is rising, and the efficiency of the process continues to improve, which means that a given amount of energy that is produced today is less expensive to produce than at any time in the past. Moreover, the costs of production continue to decline as fossil fuel plants become more efficient. The energy that

Among them are the high jobless rate, a weak housing market, the specter of more layoffs, and a general malaise that seems to have infected the U.S. heartland. That's why it's good to know that, despite the recession, some Americans are actually happy. According to a new Gallup Poll, nearly 40 percent of Americans say they are "very happy" right now, and that number has reached its highest level since 2001. How much happier is the U.S. economy than in 2001? Gallup charts how Americans' happiness levels have fluctuated over the years, and it turns out that it's as though the recession never happened. The incident occurred Thursday on a Philippine Airlines flight, the Vancouver-based airline said in a statement. The motive of the shooting is unknown, but the passenger was not shot, the airline said. The incident began when a man with a handgun approached the back of the plane in the cabin, opened fire, shot himself and then fired a second shot, Chief Corazon Montero, Manila police chief, told CNN Philippines. The man fled the aircraft before being arrested after landing in Manila. Canadian Foreign Affairs Minister Chrystia Freeland said in a statement that the attacker was stopped "before he could inflict more damage on innocent passengers." Freeland said the attacker was also killed, but she did not specify how he died. Authorities are investigating and will share more details when the investigation is complete, the Foreign Affairs Department said. "Canada strongly condemns this violent and cowardly attack," the department said in a statement. "The Canadian government stands ready to provide assistance to the Filipino authorities as required.
