Source: mykeylogger.com A tool to track a single or multiple processes. Keystroke Recorder is a small and easy to use application that captures all keyboard input events such as key down, key up, press and release, and modifier keys (ctrl, shift, alt and others). Supports most keyboards and key mappings. This is a low resource program that does not track any keystrokes - all it needs are the bytes of your keyboard's I/O and RAM. Keystroke Recorder supports on-screen and virtual keyboards. It captures all keystrokes as they're made, waiting until the key is released, so there is no delay and no lag for normal typing. It's easy to use: just set a start and end time and define the interval, and Keystroke Recorder will capture all keystrokes in that time. Keystroke Recorder supports Windows (16-bit), NT (32-bit) and 2000 (32-bit and Win9x). The following operating systems are also supported: Win95, Win98, Win98SE, WinME, Win2000, WinME, WinNT (32-bit and Win2000). It can also read a virtual keyboard layout (Keyboards/KeyboardLayouts.txt). Keystroke Recorder currently only records the ASCII-range characters. Features: \* Customizable and scalable interval (between 1 and 999 ms) \* Customizable and scalable timeout (between 1 and 999 seconds) \* Supports all keyboard I/O ports (USB and PS/2). \* Supports most keyboards and key mappings. \* Can be easily extended for even more keystrokes. \* Graphical interface shows what was captured and processed so far. \* Supports local and remote (network) installs. \* Free for personal use. \* Latest version available: 2.0.34 released on 21/09/2012 \* Downloads: Program Short Name: Keystroke Recorder Program Type: Windows Application # Keystroke Recorder 2.0.34 Copyright (C) 2013-2020 The Keystroke Recorder Team See LICENSE.txt for more information.
