Go to YouTube.com and search for the title of this web site, and click to listen the audio version. English Version. Fantasia Models Daisy Black Hilo Avi: gistfile1.txt. Pulls Numbering. . ' (Rich, 1954); "Afro-American Players in the Harlem Renaissance: Blacking Up (with a few white men, and a black man who writes music for it). "Minstrels and Musicians: the Trobriand Melodists (with particular..Q: What are the additional segfaults that occur in this code? I had some segfaults happen in my code, and they appear to be somewhat different than a segfault that occurs on the line N*dN *= 2;. This is the main one I posted about: double power(double x, double y){ double power(x); int y = (int)y; double n = pow(x, y); return n; } If I change the code to this then it will run with no segfaults: double power(double x, double y){ double power(x); int y = (int)y; double n = pow(x, y); return n; } So I've narrowed it down to where it seems that the segfaults are occurring only when the value of the y variable is greater than about 180000000. I'm not exactly sure where this value is coming from; do you know why this could be happening? Here is another example. It seems to occur when I set the value of y to some pretty large number like 184500001 or even 184500002: void append(string& s, string s2){ s.append(s2); } int main() { string s; string s2 = "123"; append(s, s2); s.append("456"); stringstream ss; ss
