More specifically, a photoresist is coated on a wafer, and the wafer is exposed to light in accordance with a circuit pattern. After the light exposure, the photoresist is developed by using a developing solution. In the recent development of the semiconductor devices, higher speed and integration have been required. Accordingly, a pattern-forming method with a smaller exposure wavelength, a high resolution, and a high accuracy has been investigated, in order to satisfy such a requirement. A pattern-forming method of a so-called phase shift mask system that uses a light having a specific wavelength has been investigated to realize a higher resolution. According to this method, in the case of forming a pattern having a line-and-space structure by using a phase shift mask, a size of a light interference fringe of a light interference effect is smaller than a pitch of the pattern. The phase shift mask may be a mask of a halftone phase shift type that is described in Japanese Laid-Open Patent Publication No. 2001-235207, a mask of a traditional phase shift type, or a mask of a double exposure phase shift type that is described in Japanese Laid-Open Patent Publication No. H09-63768. Since the pattern formed on the wafer is a pattern transferred through the mask, it is essential to obtain a pattern with a high resolution and a high accuracy. Further, the pattern is preferably a pattern formed by an exposure with a small exposure amount.Therapy dog goes to aid firefighters battling a wildfire CALGARY - A therapy dog from Calgary has travelled to a wildfire area in northern Alberta to help evacuees.
